Alpha2B-AR has a glutamic acid repeat element (amino acids 298-309) of 12 glutamates, in an acidic stretch of 18 amino acids (amino acids 294-311), located in the third intracellular loop of the receptor polypeptide. The variant is obtained by deletion of three glutamates from the Glu repeat (amino acids 307-309). Alpha2B-AR genie is located on chromosome 2. Alpha2-AR mediate many of the physiological effects of the catecholamines, norepinephrine and epinephrine. An antagonist of alpha2B-adrenoceptor is useful for treating a mammal suffering from vascular contraction of coronary arteries and a disease involving vascular contraction of coronary arteries and a clinically expressed as coronary heat disease (CHD), unstable chronic form or acute myocardial infarction (AMI). cc receptor gene (I)-(III) by detecting a polymorphic site, comprising;

(a) obtaining a sample having a polymucleotide encoding an alpha-2B,

(a) black or alpha2C or fragment or complement of; and

(b) detecting a polymorphic site comprising nucleotide positions 901-909

CC (I), a site comprising cytosine or guanine at position 753 of (IIV)

CC or a site comprising cytosine or guanine at position 753 of (IIV)

CC positions 961-972 of (III). The method may be used for genotyping an alpha2B, alpha2A or alpha2C receptor gene and further used to determine whether an individual is at increased risk of developing a disease associated with alpha2B, alpha2A or alpha2, comprising detecting a polymorphic site which correlate to disease selected from cardiovascular disease, central nervous system disease and combinations of these. In addition, the technique may be used to predict an individual's response to an alpha2B, alpha2A, or alpha2C agonist (e.g. epinephrine, constingue may be used to predict an individual's response to an alpha2B, alpha2A, or alpha2C agonist (e.g. epinephrine, constingue may be used to predict an individual's response to an alpha2B, alpha2A, or alpha2C agonist (e.g. epinephrine, dazoxan, tolazoline, phentolamine and combinations of these) or antagonist (e.g. yohimbine prazosin, ARC 239, crawolscine, idazoxan, tolazoline, phentolamine and combinations of these) by detecting the polymorphic site and correlating the site to a predetermined response (where the response is correlating the site to a predetermined response extivity, phosphorylation or inositol phosphate (cyclebal). The present sequence is that of the third intracellular loop of the human alpha-2BAR variant, the sequence is deleted for a 9 nucleotide cyclebal.
